TEST INSTRUMENT SAFETY

WARNING

An electrical shock causing 10 millamps of current to pass through the heart will stop most human heartbeats. Voltage as low as 35 volts dc or ac rms should be considered dangerous and hazardous since it can produce a lethal current under certain conditions. Higher voltages are even more dangerous. Observe the following safety precautions:

1. Do not exceed the following input ratings. Personal injury or damage to the instrument may result.

   <table>
   | DC VOLTS | 1000 V (dc + ac peak) |
   | AC VOLTS | 750 V rms |
   | OHMS     | 600 VDC or AC rms |
   | µA       | 630 mA (fuse protected) |
   | 10 A     | 10 A (fuse protected) |
   | COM      | Float voltage plus measured voltage must not exceed 1000 V (dc + ac peak) |
   </table>

2. Never use the multimeter unless the case is closed.

3. Remove test leads before performing any service on the multimeter.

4. Use only safety type test leads like those supplied with the multimeter.

5. Turn off equipment while making test connections in high-voltage circuits. Discharge high-voltage capacitors after removing power.

6. For voltage or current measurements in high-voltage equipment, do not touch equipment, meter, or test leads while power is applied.

7. If possible, familiarize yourself with the equipment being tested and the location of its high voltage points. However, remember that high voltage may appear at unexpected points in defective equipment.

8. Use an insulated floor material or floor mat to stand on, and an insulated work surface; make certain such surfaces are not damp or wet.

9. Keep “one hand in the pocket” while handling an instrument probe. Be particularly careful to avoid contacting a nearby metal object that could provide a good ground return path.

11. Some equipment with a two-wire ac power cord, including some with polarized power plugs, is the “hot chassis” type. This includes most recent television receivers and audio equipment. A plastic or wooden cabinet insulates the chassis to protect the customer. When the cabinet is removed for servicing, a serious shock hazard exists if the chassis is touched. Not only does this present a dangerous shock hazard, but damage to test instruments or the equipment under test may result. To make measurements in “hot chassis” equipment, always connect an isolation transformer between the ac outlet and the equipment under test. The B+K Precision Model TR-110 Isolation Transformer, or Model 1653A or 1655A AC Power Supply is suitable for most applications. To be on the safe side, treat all two-wire ac equipment as “hot-chassis” unless you are sure it has an isolated chassis or an earth ground chassis.

12. When testing ac powered equipment, remember that ac line voltage is usually present on some power input circuits such as the on-off switch, fuses, power transformer, etc. any time the equipment is connected to an ac outlet, even if the equipment is turned off.

13. Never work alone. Someone should be nearby to render aid if necessary. Training in CPR (cardio-pulmonary resuscitation) first aid is highly recommended.

</table>
The B+K Precision Model 5490 is a highly accurate bench-type digital multimeter with a multitude of highly advanced features. It is capable of taking the following measurements:

- ac voltages with ac (or rms) capacitive coupling
- ac voltages with ac + dc (or trms) direct coupling
- dc voltages
- ac current with ac (or rms) capacitive coupling
- ac current with ac + dc (or trms) direct coupling
- dc current
- Resistance
- Continuity
- Capacitance
- Diode threshold voltage
- Frequency
- Duty cycle
- Pulse width
- Pulse count
- dBm
- Resistive power

Features of the 5490 include:

- 0.025% DCV accuracy
- 0.07% Ohms accuracy
- 100 kHz ac response
- Autoranging, bargraph, and zoom
- Capacitance to 50.000 μF
- Frequency, duty cycle, pulse width
- dB across 1 Ω to 10 kΩ
- VA across 1 Ω to 10 KΩ
- Min/Max/Avg

Model 5470 has the same accuracy as the 5490 for all functions except dc volts. It includes all of the measurement capabilities as the 5490 except for pulse width, event counting, and VA measurement. It also is capable of temperature measurement within 0.5°C using a platinum probe.

Model 5460 is an economy version that is capable of taking many of the same measurements as the 5470 and 5490, but at a lower accuracy. It does not include Min/Max/Avg, dB measurement, VA measurement, pulse width, or pulse count and its ac voltage response is 30 kHz.

All models include 50,000 count resolution, true rms with selectable ac or ac + dc modes, safety compliance with IEC1010, shock and vibration resistance compliance with MIL-T-28800, and a three-year warranty. Models 5490 and 5470 have built-in RS-232 capability.

All models have a carrying handle that doubles as a tilt stand.

The display features clearly legible 20 mm (0.8 inch) high figures.

Refer to the SPECIFICATION section of this manual for complete specifications for each of the models.

Refer to the ACCESSORIES section of this manual for a description of each of the standard and optional accessories for the multimeters.
CONTROLS AND INDICATORS

Figures 1 through 4 illustrate the controls, indicators and connectors of the multimeters. Refer to the illustrations while reviewing the following descriptions of each of the controls.

NOTE
Throughout this section of the manual, instructions include short and long presses of buttons on the multimeter. A short press means less than one second and a long press means greater than one second.

1. **ON/OFF Button.** Turns the unit on and off. The unit is on when the button is in the engaged position and off when in the released position.

2. **Display.** 50,000 count LCD display with 20 mm (0.79") high digits, automatic decimal point, minus sign and 34 segment bar graph. Indicates 5,000 counts in low resolution mode. Annunciators for all functions, units of measurement, and blown fuse. Overrange indicated by OL. Refer to Fig. 12 and the associated text for detailed description of the display.

3. **Function Switch.** Rotary switch, selects function for AUTO ranging modes; selects function and some ranges for current modes. Primary function selected is indicated by white labeling of the switch position. The secondary function of each position is labeled in yellow and is activated by the yellow SEL button as shown in Figures 4 through 10.

4. **V Ω H-‡ Jack.** Input for DC, AC, and AC+DC Volts, capacitance, diode test, resistance, continuity, or frequency functions.

5. **COM Jack.** Input for common or reference test lead for all measurements.

6. **µA mA Jack.** Input for DC, AC, or AC+DC currents up to 500 mA.

7. **A Jack.** Input for 10 A DC, AC, or DC+AC current range.

8. **FUSE F2.** 10A, 600 V, 50 kVA fuse.

9. **FUSE F1.** 0.63A, 600 V, 1.5 kVA fuse.

10. **SEL Button (yellow).** Selects the secondary functions of the rotary Function Switch (3) indicated in yellow. Toggles between DC, AC, and AC+DC for current measurements; toggles between capacitance and diode testing; toggles between ohms and continuity checking; toggles between DC and AC+DC voltage measurements; or toggles between AC voltage and dB/Hz measurements.

11. **RANGE Button.** Manual ranging selector switch. A short press changes from the AUTO mode to MANUAL mode. Subsequent short presses advance range selection to the next higher range until the highest range is reached.
Fig. 2  Model 5470 Front Panel Controls

Fig. 3  Model 5460 Controls
11. **RANGE Button.** Manual ranging selector switch. A short press changes from the AUTO mode to MANUAL mode. Subsequent short presses advance range selection to the next higher range until the highest range is reached, then advances to the lowest range. A long press at any time returns the unit back to the AUTO ranging mode.

12. **MEM Button.** Toggles the data hold feature on and off for all functions, and enables the AUTO MEM MODE. A short press freezes the current reading on the display with the MEM annunciator on. Another short press releases the display. A long press enables the AUTO MEM MODE only in the VDC, mVDC, and VAC positions of the rotary Function Switch (3).

13. **PK +/- Button.** Enables the fast peak hold (positive and negative) capability when the rotary Function Switch (3) is set to VDC, mVDC, mADC, and 10ADC functions.

14. **REL Button.** Sets initial reading as the zero reference for making relative measurements. A short press enables the mode and sets the display to zero. Another short press disables the mode and returns the unit back to its normal mode. When in the REL mode, a long press displays the reference being used. The reference value may then be adjusted using the SEL and RANGE buttons. The SEL button is used to select the digits and the sign, while the RANGE button is used to increment the selected digit. A short press returns the unit to the REL measurement mode. Another short press returns the unit back to its normal mode.

15. **SURV Button** (5470 and 5490 only). Enables the SURVEILLANCE or MIN, MAX, AVG recording mode. A long press enables or disables the recording mode. Short presses display current values of MIN, MAX or AVG measurements. The symbols flash with selected modes. The values are stored when the SURV mode is disabled or when the unit power is switched OFF. Short presses allow the MIN, MAX, AVG values to be read. A long press enables the SURV mode and clears the previous values.

16. **Hz Button** (5470 and 5490 only). Enables frequency functions when rotary Function Switch (3) is set to VAC, VDC, mVDC, mADC and 10ADC. Short presses engage frequency measurement, % positive duty cycle, % negative duty cycle, positive pulse count, negative pulse count, positive pulse width measurement, negative pulse width measurement, and back to original rotary Function Switch (3) setting. A long press at any time returns the unit back to its original rotary Function Switch setting.

17. **ZOOM Button** (5470 and 5490 only). Expands the scale of the 34 segment analog bargraph by a factor of five for positive measurements and a factor of 11 for bipolar measurements.

18. **PRINT Button** (5470 and 5490 only). Turns on the RS232 port and sends a measurement to the printer. A short press sends one measurement. A long press allows the user to define the rate at which the measurements are sent from 00000 sec (a single transmission) up to 9 hr, 59 min, 59 sec. The SEL button is used to select the digits, while the RANGE button is used to increment the selected digit. A short press returns the unit to the PRINT mode. Another short press returns the unit to the normal mode.

19. **RS-232 Connector** (5470 and 5490 only). Interface for B+K Precision Models AK-5400 Calibration Hardware and Software Kit and AK-5450 Data Acquisition Hardware and Software Kit.

20. **AC Power Connector.** Input connector for power cord.
**CONTROLS AND INDICATORS**

**LCD INDICATORS**

Figure 12 shows all the annunciators on the LCD display. Refer to this illustration while reviewing the following descriptions.

1. **MIN MAX AVG** illuminates when the instrument is placed in surveillance mode (long press of the SURV button). Each annunciator flashes when the meter displays the particular value (short press of the SURV button).

2. **Value display.** The 20 mm high digits display the value of the measurement being taken. A – (minus sign) signifies a negative value. Positive values are implied and a positive sign is not displayed. The ° indicator to the left of the last digit signifies temperature measurement (5470 only). The last digit displays a C for Celsius or F for Fahrenheit during temperature measurements.

3. **Unit range.** The following annunciators illuminate to signify the units of measure being displayed. They are displayed with the particular unit of measure, for example MΩ for Megohm and μA for microamp.

   - n represents nano \((10^{-9})\)
   - μ represents micro \((10^{-6})\)
   - m represents milli \((10^{-3})\)
   - k represents kilo \((10^3)\)
   - M represents Mega \((10^6)\)

4. **AC+DC** illuminates when the instrument is set to take AC+DC voltage or current measurements. **AC** illuminates when the instrument is set to take AC voltage or current measurements.

5. **VA** illuminates when the instrument is set to take resistive power measurements (5490 only). The A illuminates alone when the instrument is set to take current measurements and the V illuminates alone for voltage measurements.

6. **dB** illuminates when the instrument is set to take dBm measurements (5470 and 5490).

7. **F** illuminates when the instrument is set to take capacitance measurements.

8. **Ω** illuminates when the instrument is set to check continuity.

9. **s** illuminates when the instrument is set to take pulse width measurements.

10. **Hz** illuminates when the instrument is set to take frequency measurements.

11. **Ω** illuminates when the instrument is set to take resistance measurements.

12. **Ω** illuminates when the instrument is set to test diodes.

13. **ZOOM** illuminates to signify that the bargraph scale has been expanded. The left and right bargraph scale indicators display the range of the bargraph.

14. **%** illuminates when the instrument is set to take duty cycle measurements (5470 and 5490).

15. **AVP** Pulses illuminates when the instrument is set to take duty cycle, pulse width, and pulse count measurements. A signifies positive pulses and V signifies negative pulses.

16. **Right bargraph scale** displays the units for the bargraph at the right end of the scale.

---

**Fig. 12 ** LCD Display
17. **Bargraph.** The 34-segment bargraph provides an analog display of the value.

18. **Centered Zero.** Displays when the unit is set for bipolar measurement, indicating the zero position on the bargraph.

19. **Bluetooth** illuminates when the RS232 port is active. The port is active during a print function or when the instrument is connected to a computer using the B+K Precision Model AK-5400 Calibration Kit or Model AK-5450 Data Acquisition Kit.

20. **Left bargraph scale** displays the units for the bargraph at the left end of the scale.

21. **⚠️ (Dangerous voltage) annunciator** illuminates to alert the operator that the instrument is measuring voltages greater than 24 V.

22. **REL** illuminates when the instrument is set to the relative mode (short press of the REL button).

23. **MEM** flashes to signify that the instrument has been placed in the autostore mode (long press of the HOLD button).

24. **AUTO** indicates that the instrument is in AUTO ranging mode. This is the standard mode for measurements that have more than one range.
OPERATING INSTRUCTIONS

WARNING
Use of test equipment may expose the operator to electric shock hazards. Observe all instructions contained in the TEST INSTRUMENT SAFETY section of this manual before using this instrument.

CAUTION
The TEST INSTRUMENT SAFETY section of this manual lists maximum voltage and current input limits which must be observed. Failure to adhere to these limits may result in damage to the INSTRUMENT.

NOTE
Throughout this section of the manual, instructions include short and long presses of buttons on the multimeter. A short press means less than one second and a long press means greater than one second.

TILT HANDLE
The tilt handle can be placed in any of seven positions to make it convenient for carrying or viewing. To change the position of the tilt handle, refer to Figure 13, and press in on the buttons on each handle knob to release the detent. Hold the buttons in and move the handle from the detent position and release the button. Move the handle to another position. The handle snaps into position and the buttons release to lock the handle.

ON / OFF BUTTON
Turn the unit on by depressing the ON/OFF button. All the LCD display segments come on for a few seconds, then only the appropriate annunciators for the selected function stay on. Turn the unit off by depressing and releasing the ON/OFF Button.

PROGRAMMABLE POWERUP OPTIONS
There are several operating modes that can be selected upon powerup. Typically, these modes are infrequently changed and are stored in non-volatile memory so that the selection is retained until reprogrammed.

1. 50 Hz or 60 Hz rejection.
   Hold down the MEM button and place the ON/OFF button in the ON position. The selection reverses the previous setting, is displayed for two seconds, and is stored in non-volatile memory.

2. 10MΩ / 1000MΩ input impedance for the mV range. (5470 and 5490 only).
   Hold down the RANGE button and place the ON/OFF button in the ON position. The selection reverses the previous setting, is displayed for two seconds, and is stored in non-volatile memory.

3. 5,000-count low-resolution mode.
   Hold down the REL button and place the ON/OFF button in the ON position. The display shows 5,000 for two seconds.

NOTE
The low resolution mode is not stored in non-volatile memory. If the unit is turned on after an AUTO POWER OFF with the SEL button, the unit powers up in the normal 50,000 count-high-resolution mode.

Fig. 13 Tilt Handle Operation
FUNCTION SELECTION

The rotary Function Switch selects the primary function such as VAC, mVDC, VDC, Ω, ±. All the Function Switch positions are dual or multi-functional with the primary function for each position indicated by WHITE labeling. The secondary functions for each position are indicated with YELLOW labeling, and are accessed with a press of the yellow SEL button. For example, when the rotary Function is set to the 10A DC position, the DC current function is selected. A press of the yellow SEL button puts the unit into the 10A AC (RMS) position, ready to measure AC currents with capacitive coupling. The AC annunciator illuminates on the LCD display. A second press of the SEL button puts the unit into the 10A AC+DC (TRMS) position, ready to measure AC currents with direct coupling. The AC+DC annunciator illuminates on the LCD display. A third press of the SEL button returns the unit back to the primary 10A DC function.

RANGE SELECTION

1. The AUTO ranging mode is automatically selected when the unit is turned on and whenever the rotary Function Switch is set to a new position (does not apply to single range functions such as mVDC, 10ADC or all the current ranges of the 5460).

2. A short press of the RANGE button changes the instrument to the MANUAL ranging mode. The AUTO annunciator of the LCD display turns off confirming the action. A short press advances the unit to the next higher range. Subsequent short presses advances the unit until the highest range is reached, then the next short press advances the unit to the lowest range.

3. A long press of the RANGE button at any time returns the unit to the AUTO ranging mode.

4. If the quantity to be measured is unknown, start with the highest range in the MANUAL mode, or use the AUTO ranging mode.

5. When an overrange is indicated (OL and beep), switch to the next higher range or until an on-scale measurement can be taken.

ANALOG BARGRAPH, ZOOM

The 34 segment analog bargraph feature is activated for measurements of voltage, current, resistance, frequency, and capacitance. Its update speed of 20 measurements/second is 10 times that of the digital display. This makes it suitable for measuring coarse adjustments of these parameters or indicating the direction of change of a varying quantity.

The ZOOM feature (5470 and 5490 only) expands the scale of bargraph around the measured digital reading to greatly enhance viewing fast changes. A short press of the ZOOM button increases this scale. Subsequent short presses keep expanding this scale until it returns back to its original full scale value. A long press of the ZOOM button at any time returns the bargraph back to full scale.

MEM MODE (AUTOSTORE)

The MEM button allows the user to freeze the current display or enable the MEM (Autostore) mode. A short press freezes the current display. A second short press releases the display.

The Autostore mode is used to obtain a stable voltage measurement when the user cannot look at the display and the measurement point simultaneously. Autostore is accessible in the VDC, mVDC, or VAC positions of the Function Switch.

1. A long press of the HOLD button sets the unit to the Autostore mode. The MEM annunciator flashes to confirm the selection.

2. Connect the test leads to the point to be measured. A beep indicates that the measurement is stable.

3. When the leads are removed from the test point, a second beep indicates that the reading has been stored, and the value can be viewed on the LCD display.

4. A second long press of the MEM button returns the unit to its normal mode.

RELATIVE MEASUREMENTS

When the REL button is pressed, the present reading becomes the zero reference and all subsequent readings are displayed relative to this value. A second short press disables the mode and returns the unit back to its normal mode. When in the REL mode, a long press displays the reference being used. The reference value may then be adjusted using the SEL and RANGE buttons. The SEL button is used to select the digits and the sign, while the RANGE button is used to increment the selected digit. A short press of the REL button returns the unit to the relative measurement mode. Another short press returns the unit back to its normal mode.

PEAK HOLD MEASUREMENTS

Fast (<1 ms) positive and negative peak measurements can be made when the rotary Function Switch is set to VDC, mVDC, mA DC, and 10ADC. A short press of the PK +/- button puts the unit into the positive peak detection mode, and changes the unit from the AUTO ranging mode to the MANUAL ranging mode, locking the unit on the range. If the potential peak is greater than full scale of the selected range, use the RANGE button to set the unit to the next higher range, or until an on-scale measurement is possible. The annunciator of the LCD display confirms the selection. If a negative peak detection is anticipated, press the PK +/- button a second time. The annunciator of the LCD display confirms the selection. To return the unit back to its normal mode, press the PK +/- button again.
SURV or MIN / MAX / AVG MODE (5470 and 5490 only)

The surveillance mode is useful for recording the variation of the quantity (voltage, current, resistance, capacitance, etc.) being measured by the unit. Activation of the SURV mode locks the unit into its present range and deactivates the AUTO POWER OFF feature. If the unit is in the AUTO ranging mode, it changes to the MANUAL ranging mode. A long press of the SURV button enables or disables the recording mode. Short presses display current values of MIN, MAX, or AVG measurements. The annunciators flash with each selection.

The measurements are stored even when the SURV mode is disabled or the unit power is shut off. Short presses of the SURV button allow the MIN, MAX, or AVG values to be viewed. A long press enables the SURV mode and clears the previous values.

VOLTAGE MEASUREMENTS (AC, DC, AC+DC)

1. To measure DC voltage, set the rotary Function Switch to the VDC position. If the voltage is known to be less than 500 mV, the Function Switch may be set to mVDC.

2. To measure AC+DC (TRMS) voltage with direct coupling, press the yellow SEL button with the rotary Function Switch in the VDC position.

3. To measure AC (RMS) voltage with capacitive coupling, set the rotary Function Switch to the VAC position.

4. Connect the red test lead to the \( \text{V} \rightarrow \text{H} \rightarrow \text{S} \) jack and the black test lead to the COM jack.

5. Connect the test leads to points of measurement.

6. For DC measurements, a \((-)\) sign is displayed for negative polarity; \((+)\) positive polarity is implied and is not displayed. The V annunciator is displayed.

7. For AC measurements, the AC annunciator is displayed, and for AC+DC measurements, the AC+DC annunciator is displayed.

CURRENT MEASUREMENTS (AC, DC, AC+DC)

CAUTION

For current measurements, the meter must be connected in series with the load. If incorrectly connected (in parallel with the load), the meter presents a very low impedance (almost a short), which may blow the fuse or damage the meter or equipment under test.

1. To measure DC current, set the rotary Function Switch to the desired mA DC or 10ADC position.

2. For current measurements under 500 mA, connect the red test lead to the mA jack and the black test lead to the COM jack. For current measurements over 500 mA, connect the red test lead to the A jack and the black test lead to the COM jack.

3. To measure AC (RMS) current with capacitive coupling, ensure that the Function Switch is in the mA DC or 10ADC position and press the yellow SEL button once. The AC annunciator illuminates.

4. To measure AC+DC (TRMS) current with direct coupling, ensure that the Function Switch is in the mA DC or 10ADC position, and press the yellow SEL button a second time. The AC+DC annunciator illuminates.

5. Remove power from the circuit under test and open the normal circuit path where the measurement is to be taken. Connect the meter in series with the circuit.

6. Apply power and read the value from the display.

RESISTANCE MEASUREMENTS

WARNING

To ensure operator safety, never connect leads to a live circuit when taking resistance measurements.

1. To measure resistance, set the Function Switch to the \( \Omega \) position.

2. Connect the red test lead to the \( \text{V} \rightarrow \text{H} \rightarrow \text{S} \) jack and the black test lead to the COM jack.

3. Connect the test leads to points of measurement.

4. For highest accuracy when measuring low resistance, press the RANGE button to set the unit to the 500 range, short the test leads together, and press the REL button. This zeros the meter to compensate for the resistance of the test leads.

5. For accurate measurements above 5 M\( \Omega \), use shielded test leads.
CONTINUITY MEASUREMENTS

**WARNING**

To ensure operator safety, never connect leads to a live circuit when taking resistance measurements.

1. To measure continuity, set the **Function Switch** to the Ω position, and then press the yellow SEL button. The Ω annunciator illuminates.

2. Connect the red test lead to the vΩ ′ Ω jack and the black test lead to the COM jack.

3. Connect the test leads to points of measurement. The buzzer sounds when the resistance is less than approximately 20 Ω.

**DIODE TESTING**

1. Set the **Function Switch** to the – (capacitance) position, and then press the yellow SEL button. The – annunciator illuminates.

2. Connect the red test lead to the vΩ ′ Ω jack and the black test lead to the COM jack. The red lead is (+) positive polarity.

3. To check forward voltage (Vf), connect the red lead to the anode and the black lead to the cathode. Diodes and semiconductor junctions with normal Vf of less than approximately 2 V can be checked.

4. The display indicates the forward voltage. Normal diode voltages are approximately 0.3–0.4 V for germanium diodes, 0.6–0.7 V for silicon diodes, and 1.6 V for light emitting diodes (LED). A shorted diode reads near 0 V. An open diode reads the same as with open leads.

5. Reverse the test lead connections to the diode. The reading should be the same as with open test leads. A lower reading indicates a leaky diode.

**CAPACITANCE MEASUREMENTS**

**WARNING**

Discharge all capacitors before taking any measurements. Damage to the instrument and injury to the operator could occur. To ensure operator safety, never connect the leads to a live circuit.

1. Set the **Function Switch** to the – (capacitance) position.

2. Connect the red test lead to the vΩ ′ Ω jack and the black test lead to the COM jack.

3. Connect the test leads to the capacitor. Observe polarity when measuring polarized capacitors, the red lead is (+) positive polarity.

4. Read the capacitance from the display. A shorted capacitor will indicate an overrange. An open capacitor will indicate near zero on all ranges.

5. For maximum accuracy, press the RANGE button to step to the desired range in MANUAL ranging, then press the REL button to zero the test lead capacitance before taking measurements. Always use the REL button for readings in the 50 nF range.

**FREQUENCY MEASUREMENTS**

Frequency measurement may be made when taking voltage measurements for all multimeters, and for the 5490 and 5470, while taking current measurements as well.

**NOTE**

Connect the red test lead to the appropriate current input jack if the **Function Switch** is set to mADC or 10A DC on the models 5470 and 5490.

1. Connect the red test lead to the vΩ ′ Ω jack and the black test lead to the COM jack.

2. Connect the test leads to points of measurement.

3. To measure frequency with model 5460, follow the procedure for taking voltage measurements. While the voltage measurement is displayed, press the yellow SEL button once. The frequency is then shown on the display.

4. To measure frequency with models 5470 and 5490, follow the procedure for taking voltage or current measurements. While the measurement is displayed, press the Hz button once. The frequency is then shown on the display.
**dBm MEASUREMENTS**
*(5470 and 5490 only)*

1. To measure dB in the models 5470 and 5490, set the **Function Switch** to the VAC position, then press the **SEL** button once. The dB annunciator appears.

**NOTE**
The reference impedance for dBm measurements is selectable from 1 Ω to 9999 Ω. If no selection is made, the instrument defaults to a 600 Ω selection. To change from the 600 Ω setting, use the following procedure:

a. Long press the **ZOOM** button. The impedance reference is displayed.

b. Press the **SEL** button once to select the digit to set.

c. Press the **RANGE** button to increment the selected digit.

d. Press the **SEL** button again to select the next digit to set, and the **RANGE** button to increment digit.

e. When the reference impedance is set, short press the **ZOOM** button to return the unit to VAC mode.

2. Connect the red test lead to the Ω+ jack and the black test lead to the COM jack.

3. Connect the test leads to points of measurement.

4. Read dB measurement from the display.

**RESISTIVE POWER MEASUREMENT**
*(5490 only)*

1. To measure resistive power in VA, set the **Function Switch** to the VDC position.

2. Press the **SEL** button twice to measure power. The VA annunciator appears.

**NOTE**
The reference impedance for resistive power measurements is selectable from 1 Ω to 9999 Ω. If no selection is made, the instrument defaults to a 600 Ω selection. To change from the 600 Ω setting, use the following procedure:

a. Long press the **ZOOM** button. The impedance reference is displayed.

b. Press the **SEL** button once to select the digit to set.

c. Press the **RANGE** button to increment the selected digit.

d. Press the **SEL** button again to select the next digit to set, and the **RANGE** button to increment digit.

e. When the reference impedance is set, short press the **ZOOM** button to return the unit to VAC mode.

**DUTY CYCLE MEASUREMENTS**

Duty cycle measurements can be taken while voltage measurements are taken for all meters, and while current measurements are taken using the 5490 and 5470.

1. To measure % positive duty cycle in the model 5460, set the **Function Switch** to the VAC position, and then press the yellow SEL button twice. To measure % negative duty cycle, press the yellow SEL button a third time. To measure % positive duty cycle in the models 5470 and 5490, set the rotary **Function Switch** to VAC, VDC, mVDC, mAADC, or 10ADC, then press the Hz button twice. To measure % negative duty cycle, press the Hz button a third time.

2. To perform duty cycle measurements during current measurements (5470 and 5490 only), connect the red test lead to the appropriate current input jack and the black test lead to the COM jack.

or to perform duty cycle measurements during voltage measurements, connect the red test lead to the Ω+ jack and the black test lead to the COM jack.

3. Connect the test leads to points of measurement.

4. Read % positive or % negative duty cycle from the display. The % annunciator and either the Ω or V annunciators indicate the polarity.

**PULSE WIDTH MEASUREMENTS**
*(5490 only)*

Pulse width measurements can be taken while taking voltage or current measurements.

1. To measure positive width, set the rotary **Function Switch** to VAC, VDC, mVDC, mAADC, or 10ADC, then short press the Hz button six times. To measure negative pulse width, short press the Hz button a seventh time.

2. To perform pulse width measurements during current measurements, connect the red test lead to the appropriate current input jack and the black test lead to the COM jack.

or to perform pulse count measurements during voltage measurements, connect the red test lead to the Ω+ jack and the black test lead to the COM jack.

3. Connect the test leads to points of measurement.

4. Read positive or negative pulse width from the display. The Ω or V annunciators of the LCD indicate the polarity.
PULSE COUNT MEASUREMENTS
(5490 only)

Pulse count measurements can be taken while taking voltage or current measurements. This is a totaled pulse count from the time of activation until the time of reading.

1. To measure positive pulse count, set the Function switch to VAC, VDC, mVDC, mADC, or 10ADC. Then short press the Hz button four times. To measure negative pulse count, short press the Hz button a fifth time.

2. To perform pulse count measurements during current measurements, connect the red test lead to the appropriate current input jack and the black test lead to the COM jack.

   or

   to perform pulse count measurements during voltage measurements, connect the red test lead to the VOM pH jack and the black test lead to the COM jack.

3. Connect the test leads to points of measurement.

4. Read positive or negative pulse counts from the display. The λ or ∨ annunciators of the LCD indicate the polarity.

TEMPERATURE MEASUREMENT
(5470 only)

1. To measure temperature in degrees Celsius, set the Function Switch to the ºC position. To measure temperature in degrees Fahrenheit, press the SEL button.

2. Connect the temperature probe assembly to the VΩ pH jack and the COM jack.

3. Connect the B+K Precision Model TP-5300 temperature probe to the test point.

4. Read the temperature from the display. The º symbol illuminates and the right most digit indicates C for Celsius measurement or F for Fahrenheit.
MAINTENANCE

The multimeter requires no maintenance other than replacing blown fuses. The multimeter monitors the condition of the two fuses.

The display shows FUSE 1 if fuse F1 (0.63 A) is blown. The display shows FUSE 2 if fuse F2 (10 A) is blown. If both fuses are blown, the display shows FUSES.

NOTE
Fuse F1 is tested only when the Function Switch is in the µA/mA position.

Use the following procedure to replace a blown fuse.

1. Ensure that the ON/OFF button is in the OFF (released) position, and unplug the unit from the power source.
2. Determine which fuse needs to be replaced.
3. Use a screwdriver and turn the fuseholder cap a quarter turn counterclockwise until the fuseholder cap is released.
4. Pull the fuseholder cap out of the fuseholder.
5. Replace the fuse in the fuseholder cap with one of the same type and rating.
6. Insert fuseholder cap with replacement fuse into fuseholder. Press cap in as far as it will go and turn it a quarter turn clockwise to lock.

INSTRUMENT REPAIR SERVICE

Because of the specialized skills and test equipment required for instrument repair and calibration, many customers prefer to rely upon B+K PRECISION for this service. We maintain a network of B+K PRECISION authorized service agencies for this purpose. To use this service, even if the instrument is no longer under warranty, follow the instructions given in the WARRANTY SERVICE INSTRUCTIONS portion of this manual. There is a nominal charge for instruments out of warranty.
**NOTES**

1. Unless otherwise stated, accuracy specifications apply from 18°C to 28°C.

2. Accuracy Specifications stated as n%R+nD, means ±(n% of reading + n least significant digits).

3. Accuracy Specifications stated as n%FS, means ±(n% of Full Scale)

**DC VOLTAGE (Auto/Manual Ranging)**

DCV accuracy from 21°C to 25°C (5490).

PEAK HOLD
Selection: Peak + or Peak – (surge or sag)
Acquisition Time: <1 ms
Applicable Modes: VDC, mVDC, mADC, 10ADC

dB MEASUREMENT (5490 and 5470)
Measures value relative to a reference from 1 to 99999 Ω. Factory preset for reference is 600 Ω. Refer to dBA measurement procedure to set impedance.
Accuracy in dB: 0.09 x VAC accuracy in percent
Resolution: ±0.01 dB
Measurement range: 10 mVAC to 750 VAC

DUTY CYCLE
Modes: Selectable %+, %–
Resolution: 0.01%
Minimum Pulse width: 2 μs
Maximum Pulse Period: 0.8 s
Minimum Pulse Period: 100 μs
Accuracy: Same as FREQUENCY mode

EVENT COUNTER (5490)
RANGE: 0 to 99999 (totalize)
Minimum Pulse Duration: 2 μs
Reset: Relative key
Sensitivity: 3% of range (excludes 750 V, 10 A ranges)

PULSE WIDTH (5490)
Modes: Selectable + or –
Resolution: 10 μs
Minimum Pulse Width: 20 μs
Maximum Pulse Period: 125 μs
Accuracy: ±(0.01% + 10 μs)
Sensitivity: 3% of range (excludes 750 V, 10 A ranges)

TEMPERATURE (5470)
Using Model TP-5300 Platinum Temperature Probe
Temperature Range: –300°C to +800°C
Resolution: 0.1°C
Accuracy: –125 C to +75°C: 0.5°C
–150 C to +700°C: 1.0°C
Display: °C or °F, selectable

COMPUTER INTERFACE (5470 and 5490)
RS-232 capability built-in. Requires AK-5400 or AK-5450
hardware/software kit for interconnection to computer or printer.

GENERAL SPECIFICATIONS
Display: 50,000 count LCD, 20-mm digit height, 3-segment analog bar graph.
Annunciators for function and unit of measurement.

|                        | 6 kV transient protection                                              |
|                        | 600 V high energy fuses on all current ranges                          |
| Shock & Vibration:      | MIL-T-28800                                                            |
| Case Material:          | Flame retardant, self extinguishing                                   |
| EMC                     | Emission EN55011, class B. susceptibility                               |
|                        | IEC801-4, level 3, radiation IEC 801-3 (10V/M) level 3                 |
| Calibration:            | One year, recalibration by serial interface                           |
|                        | without opening case                                                   |
